The SimCP consortium will hold a symposium at KU Leuven to present the outcomes of the SimCP project. The main goal of the SimCP project was to develop a simulation platform to predict the impact of orthopedic interventions on gait performance in children with cerebral palsy. Invited speakers will also address cerebral palsy from clinical, biomechanical, and modeling perspectives.

The symposium will include a hands-on workshop. During this workshop, attendees will have the opportunity to use the simulation platform to perform virtual surgeries (e.g., tendon transfers and femur derotation osteotomies) through a Graphical User Interface (GUI) and evaluate the impact on the gait performance of the child.
